Installation

Before installing the extension, please make sure to **Backup your web directory and store database**

You will require to install MageDelight Base Extension first. If it is not installed then please download it from <https://www.magedelight.com/pub/extensions/magedelight-base.zip> and unzip the package file into the root folder of your Magento 2 installation.

Root Directory is - "**app/code/magedelight/#YourExtensionName#**"

- Unzip the extension package file into the root folder of your Magento 2 installation.
- Connect to SSH console of your server:

- Navigate to the root folder of your Magento 2 setup
- Run command as per below sequence,

```
php bin/magento setup:upgrade
```

```
php bin/magento setup:di:compile
```

```
php bin/magento setup:static-content:deploy
```

```
php bin/magento cache:clean
```

- log out from the backend and log in again

If you are using Magento 2.3 or later then you do not need to activate license. Extension will be activated with silent activation mechanism and does not require activation keys to be entered manually.

Backend Configuration (Admin side)

Search Ultimate

General Settings

Search Engine
[global]

OpenSearch

Select the search engine for indexing and querying.

Search query based on
[global]

AND (preferable)

Search Preference
[global]

*Wildcard search at start

Allows customers to find products by part of a word. Using an asterisk (*) as a placeholder helps return more relevant results.

Enable cross-store search
[store view]

Yes

Displays results in tabs for each store view. *Note:* Works only on the search results page. Autocomplete remains store-specific.

Stores
[store view]

Default Store View

Hyva

- This section allows administrators to configure the search behavior and optimize how products are indexed and displayed in search results across the store.

Field	Description
Search Engine	Selects the backend search engine used for indexing and querying catalog data. Available options include MySQL, Elasticsearch (deprecated), and OpenSearch. OpenSearch is recommended for better performance and scalability.
Search Query Based On	Defines how multiple search terms are combined. AND (preferable) returns results containing all keywords, improving accuracy. OR returns results containing any of the keywords, increasing result breadth.
Search Preference	Controls how wildcard searches are applied to improve partial matching of search terms. Options include: • <i>Wildcard Search</i> – Matches terms containing the keyword anywhere. • <i>Wildcard search at start</i> – Matches terms ending with the keyword. • <i>Wildcard search at end*</i> – Matches terms starting with the keyword. • <i>No</i> – Disables wildcard search.
Enable Cross-Store Search	Enables displaying search results across multiple store views. When enabled, results appear in separate tabs per store on the search results page. Autocomplete remains store-specific.
Stores	Allows selection of store views where cross-store search is applicable. Only relevant when cross-store search is enabled.

Search settings

Wildcard Exceptions

Word

Add

List of keywords where wildcard search doesn't apply.

Automatic keyword replacement

Find word

Replace with

Add

Define a list of words to be automatically replaced in search queries. Multiple keywords can be added in the "Find Word" column, separated by commas.

Long-tail search expressions

Match Expression

Replace Expression

Replace Char

Add

Optimizes searches with dashes or special characters (requires reindexing). [Learn more](#)

Redirect 404 pages to search results

[global]

Redirects users from 404 pages to relevant search results.

Auto-redirect for single result

[global]

Automatically navigates to a product if it's the only match.

Enable Google sitelinks search

[global]

Adds a Sitelink Search Box to the Google search results page.

Field	Description
Wildcard Exceptions	Defines keywords for which wildcard search should not be applied. This helps maintain precise search results for specific terms.
Word	Specifies the keyword to exclude from wildcard-based search behavior.
Add	Adds the entered keyword to the wildcard exception list.
Automatic Keyword Replacement	Allows automatic replacement of search terms to improve result accuracy and handle common misspellings or synonyms.
Find Word	Defines the keyword(s) that should be detected in the search query. Multiple words can be added, separated by commas.
Replace With	Specifies the term that will replace the matched keyword in the search query.

Add (Keyword Replacement)	Adds the defined find-and-replace rule to the list.
Long-tail Search Expressions	Configures advanced search patterns using expressions to handle special characters, formatting, or complex queries.
Match Expression	Defines the pattern (e.g., regex) to identify specific search query formats.
Replace Expression	Specifies the expression used to transform the matched query into a searchable format.
Replace Char	Defines a character used during replacement, if applicable.
Add (Expression)	Adds the configured long-tail search rule.
Redirect 404 Pages to Search Results	Redirects users from non-existent (404) pages to relevant search results, improving user experience.
Auto-redirect for Single Result	Automatically redirects users to the product page if the search query returns only one result.
Enable Google Sitelinks Search	Enables a sitelinks search box in Google search results for the store, improving SEO and navigation.

Search results page

Show category filter in result page
[global]

Yes

Enables filtering search results by category.

Display search indexes as tabs (result threshold)
[store view]

2

Displays search results as tabs based on content type (e.g., products, CMS pages) when results exceed a defined threshold. To always display results in tabs, enter 0 or leave the field empty.

Highlight keywords in results
[global]

Yes

Highlights matched keywords for better visibility.

Field	Description
Show Category Filter in Result Page	Enables category-based filtering on the search results page, allowing users to refine results by category.
Display Search Indexes as Tabs (Result Threshold)	Displays search results in tabbed format based on content types (e.g., Products, CMS Pages) when the number of results exceeds the specified threshold. Enter 0 or leave empty to always display tabs.
Highlight Keywords in Results	Highlights matched search keywords within the results to improve visibility and user experience.

Category page search

Show search bar on category pages
[global]

Yes

Adds a search bar to category pages.

Minimum products for category search
bar
[global]

Defines the minimum product count required to display the search bar.

Field	Description
Show Search Bar on Category Pages	Enables a search bar on category pages, allowing users to search for products within the selected category.
Minimum Products for Category Search Bar	Defines the minimum number of products required in a category for the search bar to be displayed. If the product count is below this value, the search bar will not appear.

Content indexing and search optimization

Index CMS widgets
[global]

Yes

Includes Magento CMS widgets in search results.

Normalize accented characters
[global]

Yes

Converts accented characters to plain text for Elasticsearch.

Calculate products popularity for last
N months
[global]

5

Defines the period per which the product popularity will be considered in sorting. For all the sales time period, please set 0 or leave empty

Field	Description
Index CMS Widgets	Includes Magento CMS widgets in search indexing, allowing their content to appear in search results.
Normalize Accented Characters	Converts accented or special characters into standard text to improve search matching and consistency.
Calculate Products Popularity for Last N Months	Defines the time period (in months) used to calculate product popularity for sorting purposes. Set 0 or leave empty to consider all-time data.

Search tracking and analytics

Manage search data collection and tracking to refine search performance and user insights.

Ignored IPs for tracking

[global]

Excludes specified IPs from search analytics.

Field	Description
Ignored IPs for Tracking	Specifies IP addresses that should be excluded from search analytics and tracking. This is useful for filtering out internal or test traffic to ensure accurate search data.

Developer Logs

Check the search engine status

Verify the current status of the configured search engine to ensure it is running and accessible.

Search data reset

Deleting search indexes removes outdated or incorrect data, helps fix search issues, or applies configuration change. Reindexing is required afterward to restore search functionality.

Delete all search indexes

Removes all indexes from the current search engine connection.

Delete store-specific indexes

Removes indexes associated with the current store (by index prefix configured for search engine in store settings).

Field	Description
Check the Search Engine Status	Verifies the current status of the configured search engine to ensure it is running and accessible.
Delete All Search Indexes	Removes all search indexes from the current search engine connection. This helps resolve outdated or incorrect data issues. Reindexing is required afterward.
Delete Store-Specific Indexes	Deletes search indexes related to the current store only, based on the configured index prefix. Reindexing is required after this action to restore search functionality.

Advanced Search

Search Spell Correction

Automatically fix misspelled queries
[store view]

Yes

Suggests correct spellings for user search terms.

Display spelling fix notification in suggestions
[store view]

Yes

Enable related search
[store view]

Yes

Enable related terms when no results are found.

Field	Description
Automatically fix misspelled queries	Automatically detects and corrects spelling mistakes in user search queries to improve result accuracy.
Display spelling fix notification in suggestions	Shows a notification or suggestion to users indicating the corrected search term.
Enable related search	Displays alternative or related search terms, especially when no exact results are found.

Search Autocomplete

Autocomplete Limit
[global]

To start the autocomplete search after 3 characters, set it to **3**

Autocomplete Suggestions delay (ms)
[global]

Time in milliseconds before search suggestions appear.

Enable fast mode
[global]

Improves autocomplete performance. **Note:** Increases search index build time and requires Elasticsearch/OpenSearch.

Searchable content

	Index	Is Enabled	Max Number of results
	Products	☒	5
	Categories	☒	5
	Information	☒	5

Configure which content types appear in autocomplete suggestions and set the maximum number of results for each. Drag to reorder display priority.

Activate predictive text search
[global]

Displays predicted search terms.

Back navigation restores search results
[global]

Restores previous search results when users navigate back from autocomplete selections. Limited to one step back navigation.

Field	Description
Autocomplete Limit	Defines the minimum number of characters required before autocomplete suggestions start appearing.
Autocomplete Suggestions delay (ms)	Sets the delay (in milliseconds) before displaying search suggestions after user input.
Enable fast mode	Enhances autocomplete performance by using optimized indexing (requires Elasticsearch/OpenSearch).
Searchable content	Allows selection of content types (Products, Categories, CMS Pages) to appear in autocomplete results.
Is Enabled (per index)	Enables or disables specific content types in autocomplete suggestions.
Max Number of results	Limits the number of suggestions shown per content type in autocomplete.
Activate predictive text search	Displays predicted search queries based on user input.

Back navigation restores search results	Restores previous search results when users navigate back from autocomplete selections.
--	---

Autocomplete Appearance

Autocomplete layout

[global]

2 Columns

▼

Template selection

Template 1

▼

Choose a template layout for the autocomplete display. Click the thumbnail to view full size.

Custom css

[store view]

Add custom css for autocomplete suggestions.

Field	Description
Autocomplete layout	Defines how autocomplete results are displayed. Options include: 1 Column – displays results in a single vertical list; 2 Columns – splits results into two sections (commonly categories/content on one side and products on the other); Full Width Size – expands the autocomplete dropdown across the full width of the page for a broader display.
Template selection	Selects a predefined design template to control the look and structure of autocomplete suggestions.
Custom CSS	Allows adding custom CSS styles to modify the appearance of autocomplete suggestions as per store design requirements.

Autocomplete Product settings

Display SKU [global]	Yes	▼
Display Image Thumbnail [global]	Yes	▼
Display Price [store view]	Yes	▼
Price [global]	Database (Fast)	▼
Product prices are fetched.		
Display Rating [global]	Yes	▼
Display Description [global]	Yes	▼
Display Add to cart [global]	Yes	▼
Display Ajax cart button [global]	Yes	▼
Display stock status [global]	Yes	▼

Field	Description
Display SKU	Shows the product SKU in autocomplete suggestions for quick identification.
Display Image Thumbnail	Displays the product image thumbnail to provide visual context in suggestions.
Display Price	Enables display of product price within autocomplete results.
Price	Defines how product prices are fetched: Database (Fast) – retrieves price directly from index for faster performance; Magento (Final Price Only) – shows final calculated price (including discounts); Magento (Default Display) – uses Magento's standard pricing logic (including tier/group pricing if applicable).
Display Rating	Displays product ratings (e.g., stars) in autocomplete suggestions.
Display Description	Shows a short product description to provide additional context.
Display Add to cart	Enables "Add to Cart" button directly within autocomplete results.
Display Ajax cart button	Allows adding products to cart via AJAX without page reload.
Display stock status	Shows product availability status (e.g., In Stock / Out of Stock).

Most popular search terms

Show popular terms in search
suggestions
[store view]

Yes

Display max number of terms
[store view]

5

show no of popular terms in suggestions.

Include list of popular search terms in
suggestions
[store view]

forcefully display popular search terms. add comma-separated popular search terms. Leave empty to show the most popular terms.ex: hoodies,watches

Exclude list of popular search terms in
suggestions
[store view]

Exclude list of terms by comma-separated.

Field	Description
Show popular terms in search suggestions	Enables displaying popular or frequently searched terms in the autocomplete dropdown.
Display max number of terms	Defines the maximum number of popular search terms to show in suggestions.
Include list of popular search terms in suggestions	Allows manually specifying search terms (comma-separated) that should always appear in suggestions. If left empty, the system automatically shows top popular terms.
Exclude list of popular search terms in suggestions	Allows specifying terms (comma-separated) that should be excluded from appearing in autocomplete suggestions.

- Search Indexes allow you to manage how different types of content appear in search results. You can control indexing, update data through reindexing, and manage visibility and order of search result sections.

Field	Description
Add New Index	Creates a new search index configuration for additional content types or custom data.
ID	Displays the unique identifier of the search index.
Title	Defines the name of the index (e.g., Products, Categories, CMS Pages).
Type	Indicates the type of content being indexed, such as Product, Category, or CMS Page.
Position	Determines the display order of indexes in search results or tabs.
Status	Shows the current status of the index (e.g., Ready), indicating whether it is properly indexed and available for search.
Action (Select)	Provides row-level actions to manage the index.
Edit	Allows modification of the selected search index configuration.
Reindex	Rebuilds the selected index to update search data and reflect recent changes.
Delete	Removes the selected search index from the system.

Enable Product	1	Delete
Manufacturer	1	Delete
Add Attribute		min weight - 1,max weight - 10

- This section allows administrators to configure how a specific content type (e.g., products) is indexed and prioritized in search results. You can control visibility, ordering, and relevance by assigning weights to different attributes.

Field	Description
Back	Navigates back to the Search Indexes grid without saving changes.
Delete	Removes the current search index configuration.
Reset	Resets all unsaved changes and restores default values.
Save and Continue Edit	Saves the current configuration and allows further editing.
Save	Saves the search index configuration.

Status	Enables or disables the search index. Only enabled indexes are used in search results.
Title	Defines the name of the search index (e.g., Products).
Type	Specifies the content type being indexed (e.g., Product, Category, CMS Page).
Position	Determines the display order of this index in search results or tabs.
Attributes for Search	Lists the attributes included in search indexing and relevance calculation.
Attribute	Specifies the product attribute used for search matching (e.g., SKU, Name, Description).
Weight	Defines the importance of each attribute in search relevance. Higher values increase priority in search results.
Add Attribute	Allows adding additional attributes to be considered in search indexing.
Delete (Attribute)	Removes the selected attribute from the search configuration.

Product Score

Product Rule

Apply the rule only for the following products:

If **ALL** of these conditions are **TRUE** :

Category Gear (Children Only) **contains** **Cardio** 

Color (Children Only) **is** **Green** 

New (Parent Only) **is** **Yes** 

- Product rule allows administrators to define conditions to control which products the scoring rule will apply to. Rules are applied only to products that match all specified conditions, enabling targeted ranking adjustments.

Field	Description
Apply the Rule Only for the Following Products	Defines the scope of products to which the rule will be applied based on specified conditions.
Conditions (If ALL of These Conditions Are TRUE)	Ensures that the rule is applied only when all defined conditions are satisfied.
Attribute Condition	Specifies the product attribute used for filtering (e.g., Category, Color, New).
Operator	Defines how the condition is evaluated (e.g., contains, is, equals).
Value	Specifies the value that the attribute must match for the condition to be true.
Add Condition (+)	Allows adding additional conditions to refine product selection.
Delete Condition	Removes an existing condition from the rule.

Add Record

- This section allows administrators to define which products will appear on the landing page based on categories, search terms, and attribute-based filters. It helps create targeted product listings for specific search experiences.

Field	Description
Categories	Selects the categories from which products will be displayed on the landing page.
Search Term	Defines the keyword that triggers this landing page when searched by users.
Filters	Allows applying attribute-based conditions to refine the product collection displayed on the landing page.
Attribute	Specifies the product attribute used for filtering (e.g., Activity, Color).
Options	Defines the attribute values that products must match to be included.
Actions (Delete)	Removes the selected filter condition.
Add Record	Adds a new filter condition to further refine product selection.
Products (Section)	Contains all configurations related to selecting and filtering products for the landing page.

- This report provides insights into how users interact with search on the store, including search frequency, user behavior, and popular search terms. It helps administrators analyze trends and optimize search performance and product visibility.

Field	Description
From Date	Defines the start date for generating the search report data.
To Date	Defines the end date for the search report data range.
Group By	Groups the report data by a selected time interval (e.g., daily).
Update Report	Refreshes and generates the report based on selected filters.
Total Searches	Displays the total number of searches performed within the selected period.
Unique Searches	Shows the number of distinct search queries entered by users.
Unique Users	Indicates the number of individual users who performed searches.
Avg Searches/Day	Calculates the average number of searches performed per day.
Avg Searches/User	Shows the average number of searches performed per user.
Search Volume Analytics	Visual representation (chart) showing distribution of search activity.
Search Volume Distribution	Displays percentage breakdown of total searches, unique searches, and users.
Top Search Terms	Lists the most frequently searched keywords along with usage metrics.
Search Count	Number of times a specific search term was used.
Unique Users (per term)	Number of distinct users who searched for a specific term.

Frontend Functionality

Autocomplete Products Search Display (1-Column Layout)

When users start typing in the search bar, the autocomplete panel appears below the search field and displays results in a **single-column structured layout**. This layout presents all result types (categories, products, CMS pages) in a unified vertical list, making it simple and compact for quick scanning.

- The autocomplete dropdown appears instantly as the user types a search term.
- All results are displayed in a **single vertical column**, instead of being split into sections.
- Different result types such as **Categories, Products, and CMS pages** appear in one continuous list.

- Matching keywords are **highlighted** within the results for better visibility.
- Product results include key details like **image, name, price, stock status, and Add to Cart option**.
- The layout is **compact and space-efficient**, ideal for simpler storefront designs.
- A scroll bar appears when there are more results than visible space.
- A **“View all results”** link is provided at the bottom to access the full search results page.

Autocomplete Products Search Display (2-Column Layout)

Full-Width Autocomplete Products Search Experience

The full-width autocomplete layout provides an expanded, immersive search experience by displaying results in a large overlay panel. It allows users to browse multiple products with detailed information without leaving the current page.

- The autocomplete opens in a **full-width overlay**, covering the page for better focus and visibility.
- Displays **products** in a **multi-column grid layout**, showing more results at once.
- Each product includes **image, name, SKU, short description, rating, price, and stock status**.
- **“Add to Cart”** button is available directly within suggestions for quick purchase actions.
- Shows **total result count** and allows users to switch between **Products and Categories** tabs.
- Includes a **“View all results”** CTA to navigate to the full search results page.
- Supports **scroll within the panel**, enabling users to explore more results without page reload.
- Enhances user engagement by providing a **rich, fast, and interactive search browsing experience**.

Search Results with Highlighted Matches

The screenshot shows the LUMA website's search results for the query "Men". The page features a navigation bar with links like "What's New", "Women", "Men", "Gear", "Training", and "Sale". Below the navigation bar, the search results are organized into sections: "Compare Products" (empty), "My Wish List" (empty), and "Search In" (filters). The "Search In" section includes filters for "Men > Tops (11)", "Women > Tops (10)", "Bags (8)", "Eco Friendly (7)", "New Luma Yoga Collection (6)", "Men > Tops > Jackets (6)", "Watches (4)", "Women > Tops > Jackets (4)", "Performance Fabrics (4)", and "Fitness Equipment (3)". Below these filters, there are three tabs: "Products (40)", "Categories", and "Information (3)". The main content area displays a list of search results with the keyword "Men" highlighted in yellow. The results include "Men", "Men Sale", "Gear > Fitness Equipmentment", "Womemen", "Womemen Sale", and "Erin Recommends".

The search results page displays all relevant results based on the user's query, with matched keywords clearly highlighted to improve visibility and user navigation. This helps users quickly identify how their search term relates to the results shown.

- The searched keyword (e.g., “**Men**”) is prominently displayed at the top of the results page.
- Matching terms are **highlighted within categories, product names, and content**, making them easy to scan.
- Results are grouped into sections such as **Products, Categories, and Information** for better organization.
- The “**Search In**” filters allow users to refine results by category or collection.
- Each section shows the **count of matching results** (e.g., Products (40), Categories, Information).
- Highlighting works across partial matches (e.g., *Men* in *Women*, *Equipment*, *Recommends*).
- Users can switch between tabs (Products, Categories, Information) to explore specific result types.
- The layout ensures users can quickly identify relevant results without reading full content.

The search results page enhances user experience by automatically suggesting corrected queries and related search terms when a user enters a search phrase. This ensures users quickly find relevant products even if the original query is misspelled or not optimal.

- The **searched keyword** (e.g., “**T Shirt**”) is displayed clearly at the top, confirming the user's query.
- A “**Did you mean**” **suggestion** appears when the system detects a better or corrected version of the query (e.g., *t sport*), helping recover from typos or mismatches.
- **Related search terms** (e.g., *Shirts*, *T Shirts*) are shown to guide users toward more relevant or popular variations.
- Suggestions are **clickable**, allowing users to instantly refine their search without retyping.
- Improves **search accuracy and conversion** by redirecting users to high-result queries.
- Works dynamically based on **search behavior, synonyms, and indexed data**.
